

BLADE MOUNTING APPARATUS FOR A CUTTING IMPLEMENT

Abstract of the Invention

An apparatus for mounting a blade to a cutting implement is provided. The apparatus includes an adapter which enables the blade to be fastened with the implement with structure that is offset from its axis of rotation. With this mounting capability, structure used to secure the blade relative to the cutting implement experiences decreases occurrences of tightening relative to the blade with which it is associated. Accordingly, there is presented an enhanced ability to remove the blade when such removal is desired.
